Discover the next generation of hearing aids.

When you think of hearing aids, do you picture beige, bulky devices?

While today’s hearing aids are smaller, sleeker, and more powerful than ever, stigma still prevents many people from trying them.

If you think you might need hearing aids, looking for options with the latest technological advancements can help you better reconnect to the world around you through sound. Spending time with loved ones, being out in nature, or watching movies become more enjoyable when you can hear all the little details.

Modern hearing aids are anything but cumbersome. New styles look like earbuds while state-of-the-art sensors automatically adapt to new environments. Rechargeable options last from breakfast to bedtime and Bluetooth® lets you stream audio directly to your ears.

Hearing aid technology is constantly evolving to help people hear better. For example, here are some advancements from two of the top manufacturers. Starkey® Evolv AI hearing aids provide up to 55 million personalized adjustments hourly for high-quality sound in every environment. And Signia® Augmented Xperience (AX) technology uses a groundbreaking twin processor that lets the sounds you want to hear seem closer and crisper while background noise gets toned down.

Additionally, many hearing aid manufacturers offer smartphone apps to provide control and customization. Depending on the app, here’s some of the features that may be available:

- Adjust volume and programs
- Find tinnitus relief
- Monitor battery status
- Receive support from your hearing care professional

As a member, you have access to the latest hearing aid technology through Hear In America® where you can save on the average retail price of hearing aids.
